A multi-disciplinary team of UW researchers, headed by Douglas Zatzik, MD, Professor Associate Vice Chair for Health Services Research in the Department of Psychiatry and Behavioral Sciences, and including Department of Surgery Assistant Professor, Erik Van Eaton, MD, was recently awarded a major PCORI grant. Dr. Van Eaton is the informatics core lead on this study.

PCORI is authorized by Congress to conduct research to provide information about the best available evidence to help patients and their health care providers make more informed decisions. PCORI’s research is intended to give patients a better understanding of the prevention, treatment and care options available and the science that supports those options.

The particular research focus for the UW grant began as a group of front-line trauma center providers, patients, researchers and policy makers who worked together for over a decade to integrate patient-centered care into US trauma care systems. They began by asking large groups of injured patients the key patient-centered question “Of everything that has happened to you since your injury, what concerns you the most?” From that, the group developed scientifically sound assessment tools that allowed them to follow patient concerns after injury hospitalization.

Currently high quality patient-centered care is not the standard of care throughout US trauma care systems. Injured trauma survivors treated in trauma care systems frequently receive fragmented care that is not coordinated across hospital, emergency department, outpatient, and community settings. Post-injury care is frequently not individualized to integrate the patient’s most pressing posttraumatic concerns and preferences into medical decision making.

The team came to realize that in order to optimally integrate patient-centered care into US trauma care systems they must use the best scientific methods that capture the highest quality data. This PCORI proposal will demonstrate that post-injury care management plans integrating patient concerns and preferences can improve overall outcomes for patients, caregivers and policy makers. This project directly addresses the PCORI patient-centered research questions: “After a traumatic injury, what can I do to improve the outcomes that are most important to me? and How can front-line providers working in trauma care systems help me make the best decisions about my post-injury health and healthcare?”

Congratulations to this team for their perseverance in this project.
